Radio Integration with IP Telephony

IP phones are traditionally viewed as cost saving devices that eliminate the need for leased lines and recurring charges. IP phones however provide additional capabilities. These smart devices include user interfaces and client processing capabilities that allow applications to run on the phone that open up new service opportunities.

WAVE is one of those applications and it transforms the IP phone into a VHF radio, UHF radio, TETRA radio, P25 radio, alert/broadcast client, intercom system, or trading turret with the touch of a button.

Why clutter the desktop with additional communication devices when you can leverage your existing IP phones to provide all of these services?

WAVE transforms your IP phone into a push-to-talk radio, a financial trading turret, an alert notification system or any other communication device you want or need.
